#### Abstract :

Importance of "Informed Consent" between patients and medical teams is increasingly recognized in Japan. In the present study, we investigated the present status of hospital pharmacists both in medical school hospitals and in other teaching hospitals. Thereafter, we asked physicians, who were conducting decision making on the medication of the patients, about the opinion regarding the presence of pharmacists at the meeting of "Informed Consent" between patients and the medical teams when treatment of relatively large amount of corticosteroids was recommended. Physicians, especially in medical school hospitals, generally welcome pharmacists to the meeting with patients for the formation of "Informed Consent", and some of the doctors requested prior training and consultation if the pharmacists are to be included in the meeting. Therefore, it was revealed that the clinical training for pharmacists is desired to make a contribution to resolve drug-related problems as a specialist in the medical team.

**Keyword :** informed consent, medical team, hospital pharmacist
